Equine Wound Management

Initial management of wounds. The healing of any wound is influenced most by its initial management. Prolonged irrigation with tap water (for more than 10 minutes) should be avoided as its hypotonicity will result in cellular swelling (Moscati et al., 1998). A water-soluble hydrogel placed on the wound prior to clipping will prevent hair from becoming adhered to the wound surface.

The wound size and location determines whether a horse should be immobilised in a cast or with a splint or whether a multi-layer bandage is sufficient. Most equine wounds tend to be exudative. Foam wound dressings which "wick" exudate away from the wound but maintain a moist wound environment are therefore very useful.
